## C $\in$ Rots

(1) The output torque decreases as the rotational speed increases. Check the Output Torque graph on the right to see whether the speed required for your desired motion is supported.
(2) The allowable moment of inertia of the rotated work piece varies with the rotational speed. Check the Allowable Moment of Inertia graph on the right to see if the moment of inertia required for your desired motion is within the allowable range.
(3) The rated acceleration while moving is 0.3 G .
(4) Please note that the PMEC/PSEP controllers cannot be used when performing infinite rotation with the multiple rotation type.

Speed vs. Load Capacity
Due to the characteristics of the pulse motor, the RCP2 series' load capacity decreases at high speeds. In the table below, check if your desired speed and load capacity are supported.
