Correlation Diagram of Push Force and Current Limit

- Caution:**
- The correlation between push force and current limit value are strictly for reference purposes. Actual numbers may vary slightly.
 - The current limit value should be 20% or more because the push force would be unstable when the current limit value is lower than 20%.

- POINT**
Note on selection
- (1) For push mode operation, please see P. 22 to check the allowable time period of a continuous push-motion with a different thrust force. Also, please check that the allowable continuous operational thrust force (please see P. 23) for the actual push cycle is less than the allowable continuous operational thrust force. (Even if there is no push motion)
 - (2) Customer's tooling is to be mounted on the load cell itself. In case any radial or moment load is applied to the load cell, please consider adding the external guides, etc. to offset those side loads.
 - (3) When using front flange and bracket, please install a support block for the horizontal installation of an actuator with 150mm-stroke or longer. However, adding the support block even for less than 150mm-stroke is recommended since vibration might occur depending on the operational and installation condition and damage the actuator.
 - (4) Force control is only for pushing motion, not valid for pulling motion.
