*Can be installed with above orientations.

Correlation Graph of Speed, Output Torque and Allowable Moment of Inertia

- POINT**
Note on selection
- The output torque gets lower as the rotation speed gets faster. Check the output torque graph on the right to see if the necessary speed for the application is possible.
 - The allowable moment of inertia on the rotated work piece will differ depending on the rotation speed. Check the allowable moment of inertia graph on the right to see if the necessary moment of inertia for the application is in the allowable range.
 - The rated acceleration while moving is 0.2 G.
 - Note that PMEC/PSEP Controllers are not capable of infinite rotation operation when used with multi-rotation actuators.

Note

*The shaded area in the top view shows the rotation area.

Note

The rotational part is shown in the home position of the top view, for both standard and reversed rotation (option) types.
At the home-return operation, standard type rotates to the left in the top view to return to home, and rotates to the right for operation after home-return operation is completed.
Reversed rotation type rotates to the right in the top view to return to home, and rotates to the left for operation after home-return operation is completed.
It is not possible to change the rotational direction after delivery due to structural reason.

② Applicable Controllers

The RCP2CR/RCP2W series actuators can operate with the controllers below. Select the controller according to your usage.
